### Telecom Israel Conference, 2004 – Security session

Terror actions around the world which were intensified in the last few years emphasized the need for international security community to find solutions against terror.

Due to its international nature terror can be operated in one country while it's other operations such as: budgeting, design and commands (as other features of the threat) can be located in other countries.

It is the first goal of every security or defense organization to have preliminary information about an upcoming terror threat.

Telecommunication infrastructures are used both for terror and security activity. There is a need to avoid the Terror groups to use the telecommunication channels. For Security and defense organizations the telecommunication infrastructures are a source for information and a building block for new systems to overcome the new threat.

The security session will present various aspects of the ideas, research, development and existing systems in this field.

The session will be chaired by:

Dr. Avi Galor (Ginzburg)

VP for Research and Development

RAFAEL – Armament Development Authority Ltd. Israel
